

AMENDMENTS TO THE CLAIMS

Claim 1. (Currently Amended)

An image display apparatus, comprising:

an image signal processing circuit receiving an image signal and processing the image signal for display as an image;

an image display unit receiving the image signal processed by the image signal processing circuit, and displaying the processed image signal as an image on a screen; and

E! control
a control circuit receiving said image signal from said image signal processing circuit and varying a ~~waveform~~ frequency characteristic of the image signal in a periodic manner.

Claim 2. (Currently Amended)

The image display apparatus of claim 1, wherein the image is divided into spatial lines and temporal frames, and the control circuit alters said ~~waveform~~ frequency characteristic once per spatial line in each temporal frame.

Claim 3. (Currently Amended)

The image display apparatus of claim 2, wherein the control circuit also alters said ~~waveform~~ frequency characteristic once per said temporal frame in each said spatial line.

Claim 4. (Currently Amended)

The image display apparatus of claim 3, wherein the control circuit comprises a timing circuit receiving a first synchronizing signal indicating said spatial lines and a second synchronizing indicating said temporal frames, and generating a timing signal by dividing a frequency of the first synchronizing signal, toggling the timing signal once per said spatial line and reversing a phase of the timing signal once per said temporal frame, said ~~waveform~~ frequency characteristic being controlled according to the timing signal.

E!
could

Claim 5. (Currently Amended)

The image display apparatus of claim 1, wherein the control circuit has a variable inductance element, ~~and varies said waveform characteristic by passing~~ the image signal passes through said the variable inductance element, and the control circuit varies the inductance value of said variable inductance element in a periodic manner, thereby varying said frequency characteristic of said image signal in a periodic manner.

Claim 6. (Original)

The image display apparatus of claim 5, wherein the variable inductance element comprises a coil having a primary winding and a secondary winding, the

image signal passing through the primary winding, the control circuit alternately opening and closing the secondary winding.

Claim 7. (Previously Presented)

An image display apparatus, comprising:

an image signal processing circuit receiving an image signal and processing the image signal for display as an image;

*E!
could* an image display unit receiving the image signal processed by the image signal processing circuit, and displaying the processed image signal as an image on a screen; and

a control circuit varying a waveform characteristic of the image signal in a periodic manner,

wherein said waveform characteristic is an amplitude characteristic, and the control circuit comprises:

a first amplifier circuit amplifying the image signal with a first gain characteristic;

a second amplifier circuit amplifying the image signal with a second gain characteristic differing from the first gain characteristic; and

a timing circuit selecting the first amplifier circuit and the second amplifier circuit alternately.

Claim 8. (Original)

The image display apparatus of claim 7, wherein the second amplifier circuit includes a frequency compensation network causing the second gain characteristic to differ from the first gain characteristic at certain frequencies.

Claim 9. (Previously Presented)

An image display apparatus, comprising:

*E!
cont'd*
an image signal processing circuit receiving an image signal and processing the image signal for display as an image;

an image display unit receiving the image signal processed by the image signal processing circuit, and displaying the processed image signal as an image on a screen; and

a control circuit varying a waveform characteristic of the image signal in a periodic manner,
wherein said waveform characteristic is a timing characteristic, and the control circuit comprises:

a first amplifier circuit amplifying the image signal;

a delay line delaying the image signal;

a second amplifier circuit coupled to the delay line, amplifying the delayed image signal; and

a timing circuit selecting the first amplifier circuit and the second amplifier circuit alternately.

Claim 10. (Currently Amended)

An image display apparatus comprising: The image display apparatus of claim 1,

an image signal processing circuit receiving an image signal and processing the image signal for display as an image;

E! cont'd
an image display unit receiving the image signal processed by the image signal processing circuit, and displaying the processed image signal as an image on a screen; and

a control circuit receiving said image signal from said image signal processing circuit and varying a waveform characteristic of the image signal in a periodic manner,

further comprising a control unit that determines a resolution of the image signal and activates the control circuit, depending on the resolution.

Claim 11. (Cancelled)

Claim 12. (Currently Amended)

A method of processing an image signal for display as an image by an image display unit, comprising the step of:

processing the received image signal for display as an image;

obtaining data from said image signal directly received at a control circuit;

periodically varying a ~~waveform~~ frequency characteristic of the processed image signal by acting directly on said image signal.

Claim 13. (Currently Amended)

The method of claim 12, wherein the image is divided into spatial lines and temporal frames, and said step of periodically varying alters said ~~waveform~~ frequency characteristic once per spatial line in each temporal frame.

E!
could
Claim 14. (Currently Amended)

The method of claim 13, wherein said step of periodically varying also alters said ~~waveform~~ frequency characteristic once per said temporal frame in each said spatial line.

Claim 15. (Currently Amended)

The method of claim 12, wherein
said step of periodically varying further comprises the step of passing the image signal through a variable inductance element and then varying the inductance value of said variable inductance element in a periodic manner, to vary said frequency characteristic of said image signal in a periodic manner.

Claim 16. (Previously Presented)

A method of processing an image signal for display as an image by an image display unit, comprising the step of:

periodically varying a waveform characteristic of the image signal,

wherein said step of periodically varying further comprises the steps of:

amplifying the image signal with a first gain characteristic to generate a first amplified signal;

amplifying the image signal with a second gain characteristic, differing from the first gain characteristic, to generate a second amplified signal; and

selecting the first amplified signal and the second amplified signal alternately.

Claim 17. (Cancelled)

Claim 18. (Currently Amended)

A method of processing an image signal for display as an image by an image display unit, comprising the steps of:

processing the received image signal for display as an image;

obtaining data from said image signal directly received at a control circuit;

periodically varying a waveform characteristic of the processed image signal

by acting directly on said image signal,

*E!
could* ~~The method of claim 12,~~ further comprising the step of determining a resolution of the image signal, said step of periodically varying being performed depending on the resolution.

Claim 19. (Cancelled)
